## HIV/AIDS estimates

In 2003 and during the first quarter of 2004, UNAIDS and WHO worked closely with national governments and research institutions to recalculate current estimates on people living with HIV/AIDS. These calculations are based on the previously published estimates for 1999 and 2001 and recent trends in HIV/AIDS surveillance in various populations. A methodology developed in collaboration with an international group of experts was used to calculate the new estimates on prevalence and incidence of HIV and AIDS deaths, as well as the number of children infected through mother-to-child transmission of HIV. Different approaches were used to estimate HIV prevalence in countries with low-level, concentrated or generalised epidemics. The current estimates do not claim to be an exact count of infections. Rather, they use a methodology that has thus far proved accurate in producing estimates that give a good indication of the magnitude of the epidemic in individual countries. However, these estimates are constantly being revised as countries improve their surveillance systems and collect more information.

Adults in this report are defined as women and men aged 15 to 49. This age range covers people in their most sexually active years. While the risk of HIV infection obviously continues beyond the age of 50, the vast majority of those who engage in substantial risk behaviours are likely to be infected by this age. The 15 to 49 range was used as the denominator in calculating adult HIV prevalence.

### Estimated number of adults and children living with HIV/AIDS, end of 2003

These estimates include all people with HIV infection, whether or not they have developed symptoms of AIDS, alive at the end of 2003:

|                     |           |                |     |
|---------------------|-----------|----------------|-----|
| Adults and children | 570,000   |                |     |
| Low estimate        | 310,000   |                |     |
| High estimate       | 1,000,000 |                |     |
| Adults (15-49)      | 560,000   | Adult rate (%) | 1.5 |
| Low estimate        | 310,000   | Low estimate   | 0.8 |
| High estimate       | 1,000,000 | High estimate  | 2.8 |
| Children (0-15)     | 12,000    |                |     |
| Low estimate        | 5,700     |                |     |
| High estimate       | 24,000    |                |     |
| Women (15-49)       | 200,000   |                |     |
| Low estimate        | 110,000   |                |     |
| High estimate       | 370,000   |                |     |

### Estimated number of deaths due to AIDS

Estimated number of adults and children who died of AIDS during 2003:

|                |        |
|----------------|--------|
| Deaths in 2003 | 58,000 |
| Low estimate   | 34,000 |
| High estimate  | 97,000 |

### Estimated number of orphans

Estimated number of children who have lost their mother or father or both parents to AIDS and who were alive and under age 17 at the end of 2003:

|                        |
|------------------------|
| Current living orphans |
| Low estimate           |
| High estimate          |

## UNAIDS/WHO Working Group on Global HIV/AIDS and STI Surveillance

Global Surveillance of HIV/AIDS and sexually transmitted infections (STIs) is a joint effort of WHO and UNAIDS. The UNAIDS/WHO Working Group on Global HIV/AIDS and STI Surveillance, initiated in November 1996, guides respective activities. The primary objective of the Working Group is to strengthen national, regional and global structures and networks for improved monitoring and surveillance of HIV/AIDS and STIs. For this purpose, the Working Group collaborates closely with national AIDS programmes and a number of national and international experts and institutions. The goal of this collaboration is to compile the best information available and to improve the quality of data needed for informed decision-making and planning at national, regional, and global levels. The Epidemiological Fact Sheets are one of the products of this close and fruitful collaboration across the globe.

Within this framework, the Fact Sheets collate the most recent country-specific data on HIV/AIDS prevalence and incidence, together with information on behaviours (e.g. casual sex and condom use) which can spur or stem the transmission of HIV.

Not unexpectedly, information on all of the agreed upon indicators was not available for many countries in 2003. However, these updated Fact Sheets do contain a wealth of information which allows identification of strengths in currently existing programmes and comparisons between countries and regions. The Fact Sheets may also be instrumental in identifying potential partners when planning and implementing improved surveillance systems.

The fact sheets can be only as good as information made available to the UNAIDS/WHO Working Group on Global HIV/AIDS and STI Surveillance. Therefore, the Working Group would like to encourage all programme managers as well as national and international experts to communicate additional information to them whenever such information becomes available. The Working Group also welcomes any suggestions for additional indicators or information proven to be useful in national or international decision-making and planning.

## Assessment of the epidemiological situation

### 2004

The first case of AIDS in Thailand was reported in September 1984. While the early AIDS cases were reported predominantly among Thai homosexual males, subsequently, the virus spread rapidly to injecting drug users, and to sex workers and their clients. As of January 2004, 231,712 AIDS cases have been reported, of whom nearly 80% were in the age group 20-39 years. The male-to-female ratio of reported AIDS cases is 2.8:1. Of the AIDS cases reported to date with a known route of transmission, heterosexual mode accounts for the highest proportion of cases (88%), followed by injecting drug use (6%) and perinatal transmission (5%).

Data from a comprehensive sentinel surveillance system indicate that the HIV prevalence among pregnant women, after reaching a peak of 2.35% in 1995, has consistently declined in the past five years to reach 1.18% in 2003. Nationally, HIV prevalence among military conscripts decreased markedly from 4% in 1993 to 0.5% in 2003. Among commercial sex workers, HIV prevalence peaked in the mid-nineties and has constantly declined since then. The HIV prevalence among injecting drug users, however, remains high at 33% in 2003 and poses a major challenge to HIV control in Thailand. The HIV prevalence among the other high risk groups in 2003 was: female direct sex workers (10.87%); male sex workers (7.90%), fishermen (6.86%); male STD clients (4.00%); female indirect sex workers (3.67%); and blood donors (0.27%). At the end of 2003, an estimated 1.7% of the adult Thai population aged 15-49 years was infected with HIV. The estimated number of PLWHAs at the end of 2003 was 570,000.

Although Thailand has achieved substantial success in HIV control with the annual number of new HIV infections dropping from 142,819 in 1991 to 21,260 in 2003, the AIDS crisis will continue to grow as the large number of PLWHAs who were infected during the past 10 years or earlier will develop AIDS in the coming years. According to projections for the next five years, nearly 50,000 new AIDS cases will occur in Thailand every year. To address the needs of the PLWHAs, the Thai government has been expanding its antiretroviral programme since 2000. Currently, approximately 13,000 PLWHAs are on antiretroviral therapy. The government has committed to the goal of universal access to care and has allocated 25 million US dollars in fiscal year 2004 to scale up access to ARV to 50,000 PLWHAs.

## Basic indicators

For consistency reasons the data used in the table below are taken from official UN publications.

| DEMOGRAPHIC DATA                                  | YEAR      | ESTIMATE | SOURCE                          |
|---|-----------|----------|---------------------------------|
| Total population (thousands)                      | 2004      | 63,465   | UN population division database |
| Female population aged 15-24 (thousands)          | 2004      | 5,615    | UN population division database |
| Population aged 15-49 (thousands)                 | 2004      | 36,225   | UN population division database |
| Annual population growth rate (%)                 | 1992-2002 | 1.1      | UN population division database |
| % of population in urban areas                    | 2003      | 31.8     | UN population division database |
| Average annual growth rate of urban population    | 2000-2005 | 1.9      | UN population division database |
| Crude birth rate (births per 1,000 pop.)          | 2004      | 17       | UN population division database |
| Crude death rate (deaths per 1,000 pop.)          | 2004      | 7.1      | UN population division database |

## HIV prevalence in different populations

This section contains information about HIV prevalence in different populations. The data reported in the tables below are mainly based on the HIV database maintained by the United States Bureau of the Census where data from different sources, including national reports, scientific publications and international conferences are compiled. To provide a simple overview of the current situation and trends over time, summary data are given by population group, geographical area (Major Urban Areas versus Outside Major Urban Areas), and year of survey. Studies conducted in the same year are aggregated and the median prevalence rates (in percentages) are given for each of the categories. The maximum and minimum prevalence rates observed, as well as the total number of surveys/sentinel sites, are provided with the median, to give an overview of the diversity of HIV-prevalence results in a given population within the country. Data by sentinel site or specific study from which the medians were calculated are printed at the end of this fact sheet.

The differentiation between the two geographical areas Major Urban Areas and Outside Major Urban Areas is not based on strict criteria, such as the number of inhabitants. For most countries, Major Urban Areas were considered to be the capital city and - where applicable - other metropolitan areas with similar socio-economic patterns. The term Outside Major Urban Areas considers that most sentinel sites are not located in strictly rural areas, even if they are located in somewhat rural districts.

### HIV sentinel surveillance\*

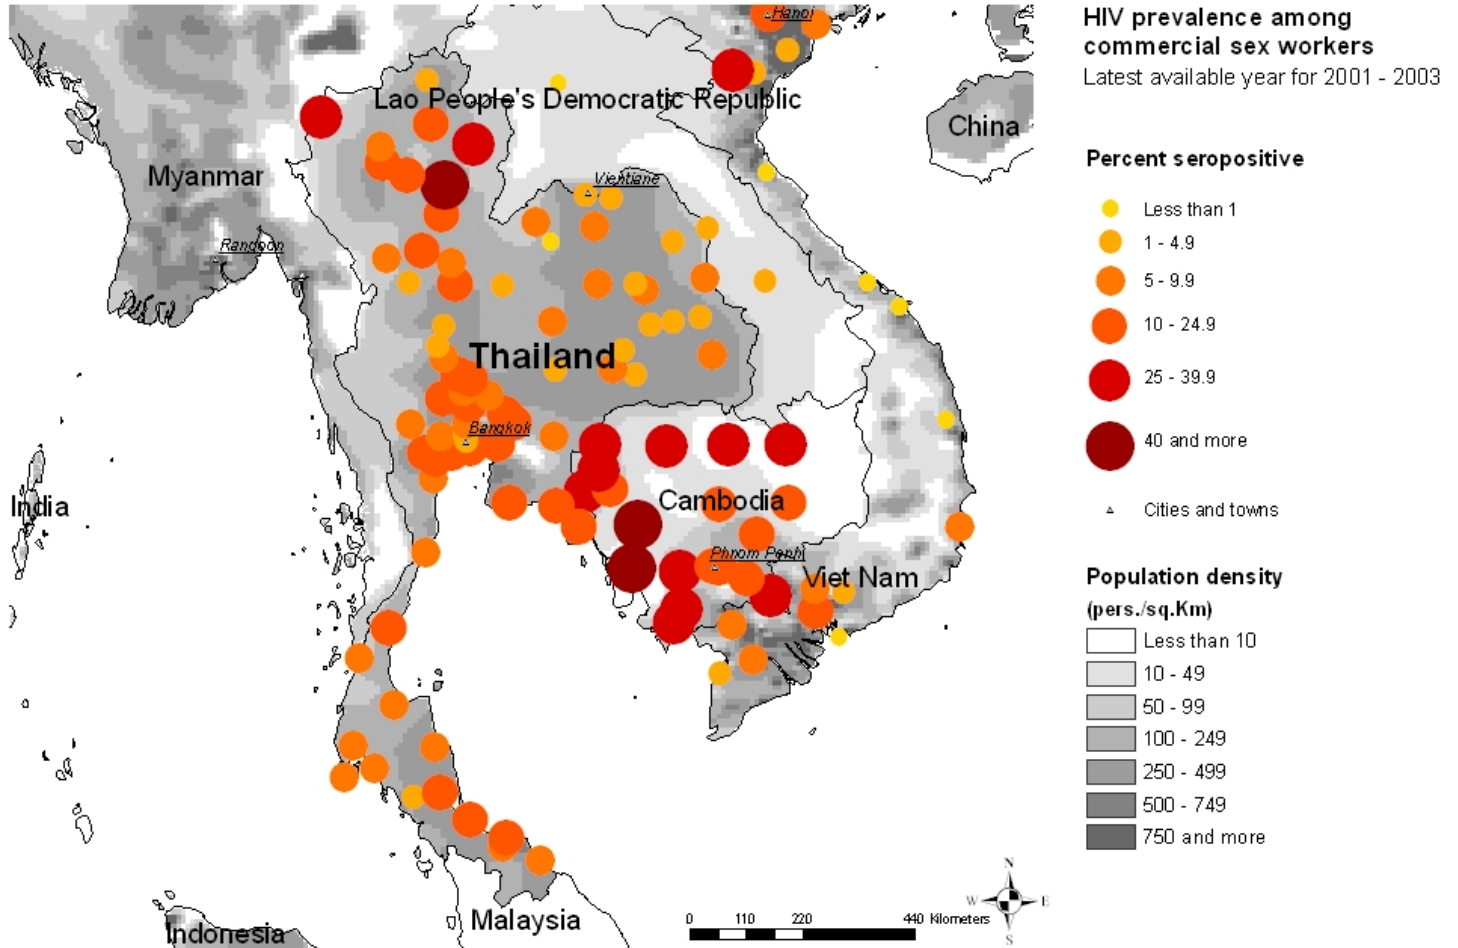

| Group                     | Area                      |                   | 1987    | 1988  | 1989  | 1990  | 1991  | 1992  | 1993  | 1994  | 1995  | 1996  | 1997  | 1998  | 1999  | 2000  | 2001  | 2002  | 2003  |  |  |

## Maps & charts

Mapping the geographical distribution of HIV prevalence among different population groups may assist in interpreting both the national coverage of the HIV surveillance system as well in explaining differences in levels of prevalence. The UNAIDS/WHO Working Group on Global HIV/AIDS and STI Surveillance, in collaboration with the WHO Public Health Mapping Team, Communicable Diseases, is producing maps showing the location and HIV prevalence in relation to population density, major urban areas and communication routes. For generalized epidemics, these maps show the location of prevalence of antenatal surveillance sites.

Trends in antenatal sentinel surveillance for higher prevalence countries, or in prevalence among selected populations for countries with concentrated epidemics, are a new addition. These are presented for those countries where sufficient data exist.

Trends in HIV prevalence among antenatal clinic attendees

Median prevalence and ranges are shown in areas with more than one sentinel site.

The boundaries and names shown and the designations used on the map do not imply the expression of any opinion whatsoever on the part of the World Health Organization concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries. Dotted lines on maps represent approximate border lines for which there may not yet be full agreement. WHO 2004, all rights reserved.

## Reported AIDS cases

Following WHO and UNAIDS recommendations, AIDS case reporting is carried out in most countries. Data from individual AIDS cases are aggregated at the national level and sent to WHO. However, case reports come from surveillance systems of varying quality. Reporting rates vary substantially from country to country and low reporting rates are common in developing countries due to weaknesses in the health care and epidemiological systems. In addition, countries use different AIDS case definitions. A main disadvantage of AIDS case reporting is that it only provides information on transmission patterns and levels of infection approximately 5-10 years in the past, limiting its usefulness for monitoring recent HIV infections.

Despite these caveats, AIDS case reporting remains an important advocacy tool and is useful in estimating the burden of HIV-related morbidity as well as for short-term planning of health care services. AIDS case reports also provide information on the demographic and geographic characteristics of the affected population and on the relative importance of the various exposure risks. In some situations, AIDS reports can be used to estimate earlier HIV infection patterns using back-calculation. AIDS case reports and AIDS deaths have been dramatically reduced in industrialized countries with the introduction of Anti-Retroviral Therapy (ART).

## Curable sexually transmitted infections (STIs)

The predominant mode of transmission of both HIV and other STIs is sexual intercourse. Measures for preventing sexual transmission of HIV and STIs are the same, as are the target audiences for interventions. In addition, strong evidence supports several biological mechanisms through which STIs facilitate HIV transmission by increasing both HIV infectiousness and HIV susceptibility. Thus, detection and treatment of individuals with STIs is an important part of an HIV control strategy. In summary, if the incidence/prevalence of STIs is high in a country, then there is the possibility of high rates of sexual transmission of HIV. Monitoring trends in STIs provides valuable insight into the likelihood of the importance of sexual transmission of HIV within a country, and is part of second generation surveillance. These trends also assist in assessing the impact of behavioural interventions, such as delaying sexual debut, reducing the number of sex partners and promoting condom use.

Clinical services offering STI care are an important access point for people at high risk for both STIs and HIV. Identifying people with STIs allows for not only the benefit of treating the STI, but for prevention education, HIV testing, identifying HIV-infected persons in need of care, and partner notification for STIs or HIV infection. Consequently, monitoring different components of STI prevention and control can also provide information on HIV prevention and control activities within a country.

## Health service and care indicators

HIV prevention strategies depend on the twin efforts of care and support for those living with HIV or AIDS, and targeted prevention for all people at risk or vulnerable to the infection. It is difficult to capture such a large range of activities with one or just a few indicators. However, a set of well-established health care indicators may help to identify general strengths and weaknesses of health systems. Specific indicators, such as access to testing and blood screening for HIV, help to measure the capacity of health services to respond to HIV/AIDS - related issues.

### Access to health care

| Indicators   | Year | Estimate | Source       |
|--|------|----------|--------------|
| % of population with access to health services - total |      |          |              |
| % of population with access to health services - urban |      |          |              |
| % of population with access to health services - rural |      |          |              |
| Contraceptive prevalence rate (%)                      | 1997 | 72.2     | UNICEF/UNPOP |
| Percentage of contraceptive users using condoms        |      |          |              |
| % of births attended by skilled health personnel       | 2000 | 85       | WHO          |
| % of 1-yr-old children fully immunized - DPT           | 2002 | 96       | WHO/UNICEF   |
| % of 1-yr-old children fully immunized - Measles       | 2001 | 94       | WHO/UNICEF   |
| % of ANC clinics where HIV testing is available        |      |          |              |

## Knowledge and behaviour

In most countries the HIV epidemic is driven by behaviours (e.g.: multiple sexual partners, injecting drug use) that expose individuals to the risk of infection. Information on knowledge and on the level and intensity of risk behaviour related to HIV/AIDS is essential in identifying populations most at risk for HIV infection and in better understanding the dynamics of the epidemic. It is also critical information in assessing changes over time as a result of prevention efforts. One of the main goals of the 2nd generation HIV surveillance systems is the promotion of a standard set of indicators defined in the National Guide (Source: National AIDS Programmes, A Guide to Monitoring and Evaluation, UNAIDS/00.17) and regular behavioural surveys in order to monitor trends in behaviours and to target interventions.

The indicators on knowledge and misconceptions are an important prerequisite for prevention programmes to focus on increasing people's knowledge about sexual transmission, and, to overcome the misconceptions that act as a disincentive to behaviour change. Indicators on sexual behaviour and the promotion of safer sexual behaviour are at the core of AIDS programmes, particularly with young people who are not yet sexually active or are embarking on their sexual lives, and who are more amenable to behavioural change than adults. Finally, higher risk male-male sex reports on unprotected anal intercourse, the highest risk behaviour for HIV among men who have sex with men.

### Knowledge of HIV prevention methods

Prevention indicator: Percentage of young people 15-24 who both correctly identify two ways of preventing the sexual transmission of HIV and who reject three misconceptions about HIV transmission.

| Year | Male | Female |
|------|------|--------|
|      |      |        |

## Prevention indicators

Male and female condoms are the only technology available that can prevent sexual transmission of HIV and other STIs. Persons exposing themselves to the risk of sexual transmission of HIV should have consistent access to high quality condoms. AIDS Programs implement activities to increase both availability of and access to condoms. These activities should be monitored and have resources directed to problem areas. The indicator below highlights the availability of condoms. However, even if condoms are widely available, this does not mean that individuals can or do access them.

### Condom availability nationwide

Total number of condoms available for distribution nationwide during the preceding 12 months, divided by the total population aged 15-49.

| Year | N | Rate |
|------|---|------|
|------|---|------|

Comments:

## Sources

Data presented in this Epidemiological Fact Sheet come from several sources, including global, regional and country reports, published documents and articles, posters and presentations at international conferences, and estimates produced by UNAIDS, WHO and other United Nations agencies. This section contains a list of the more relevant sources used for the preparation of the Fact Sheet. Where available, it also lists selected national Web sites where additional information on HIV/AIDS and STI are presented and regularly updated. However, UNAIDS and WHO do not warrant that the information in these sites is complete and correct and shall not be liable whatsoever for any damages incurred as a result of their use.
